Your Panel Report – Some frequently asked questions

What is a Panel Report?

- It is a personalized report providing aggregate information about your panel of patients
- Your panel report does not include information about individual patients, rather it provides an overview of what types of patients you see, how they are managed for cancer screening, and chronic diseases (diabetes and coronary artery disease), how much they are using hospital services and some details about their drug prescriptions
- Every physician's report is comprised of the same standardized indicators but reflects the results for their own panel. Some indicators also provide the physician's Health Network results to enable comparison.
- Each page of the report covers one topic. Each includes the results from your panel for each indicator as well as some additional information regarding the indicators.
- At the end of the report, there are some additional resources related to each topic to enable further investigation and learning.

Who created it and why?

- The Saskatchewan Medical Association (SMA) asked the Saskatchewan Health Quality Council (HQC) to help them develop reports for physicians in the province.
- Similar reports exist for physicians in British Columbia, Ontario, and Alberta and the SMA wanted to ensure similar information is available to those practicing in Saskatchewan.
- A partnership developed between physicians, HQC and eHealth Saskatchewan:
 - The SMA initiated the work and is promoting it amongst its members;
 - A panel of physicians, formed by the College of Family Physicians, generates and selects the questions and indicators to be included;
 - HQC determines the data sources, calculations, and visualization for each indicator and designs the reports; and
 - eHealth Saskatchewan produces and distributes the individual reports.

Where did the information come from?

- All of the data used to calculate each indicator came from existing administrative health data bases, such as
 - the Medical Services Branch physician billing data (for physician visits),
 - the Population Health Registry System (for patient demographics),
 - the Chronic Disease Management Quality Improvement Program (CDM-QIP), for data regarding diabetic and coronary artery disease patient care

- the National Acute Care Registration System (emergency department visits)
 - the Discharge Abstract Database (for hospitalizations), and
 - The Prescription Drug Program (for drug dispensations)
- The panel-specific results in your report are based on your patients and you are the only recipient of your report

How was my network identified?

Your network was determined based on the billing records you submitted to the MSB. The network in which each patient visit occurred was identified; the network in which the highest proportion of your visits occurred was deemed your network.

- The Health Network results combine the panel-specific results of other family physicians working in the same network to enable comparison.

What time period does it cover?

The report reflects health service use and the corresponding patient population for three years. The 2021 report is based on data from January 1, 2017 to December 31, 2019.

Our goal is to produce the reports annually, each based on the most recent years.

What does it tell me?

There are 6 categories of topics:

Panel Characteristics	• demographics of your patient population
Primary Care	• family physician care among your patients
Chronic Disease Management	• diabetic and coronary artery disease patient results
Emergency Department Use	• volume and acuity of visits
Acute Care Admissions	• volume and causes of admissions
Prescription drugs	• use of select types of prescription medications among your patients

How do I use it?

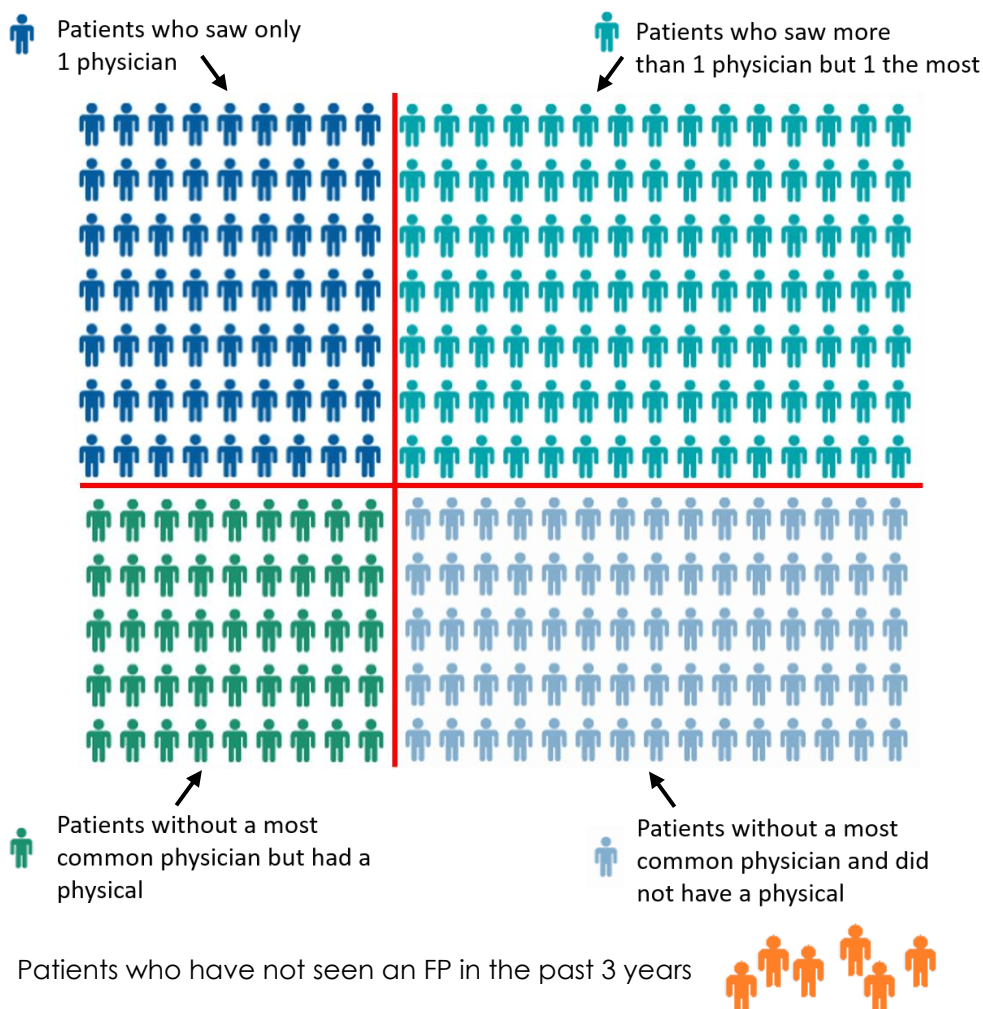

- Be curious!
- Consider...
 - Does the panel population reflect those in your EMR?
 - Are there any indicators where you see unexpected results?
 - If any of your results differ substantially from your Health Network results – are the differences reasonable? They may very well be! But ask yourself the questions, consider your context.
 - Are certain health concerns or conditions prevalent among your patients? Is there any additional programming, education or supports that your clinic can offer or that you can refer your patients to that can help them better manage their conditions?
 - Are your panel patients with chronic diseases being well-managed?
 - Are your prescription rates notably different or concerning for any of the classes of drugs assessed? Are differences warranted, taking into consideration your context and patients? Are any trends developing?
- The end of the report has some additional resources and questions you can use to help you start your thought process and can trigger additional questions.
 - To go even further, see the Investigation guide available on the BestPracticeSask.ca website, or sign up for an Investigation workshop.
 - Complete either of these for Certified Mainpro+ credits!

How did you determine which patients are included in my panel?

We applied the 4-cut methodology, developed by the Alberta Health Services. This method uses billing data to assign patients to physician panels by applying 4 criteria based on the frequency of their visits over the past 3 years. All patients are assigned to only one physician's panel. Your panel may include patients you see regularly as well as patients you saw in a walk-in clinic or other setting. It depends on patient's other family physician interactions.

How does the 4-cut method work?

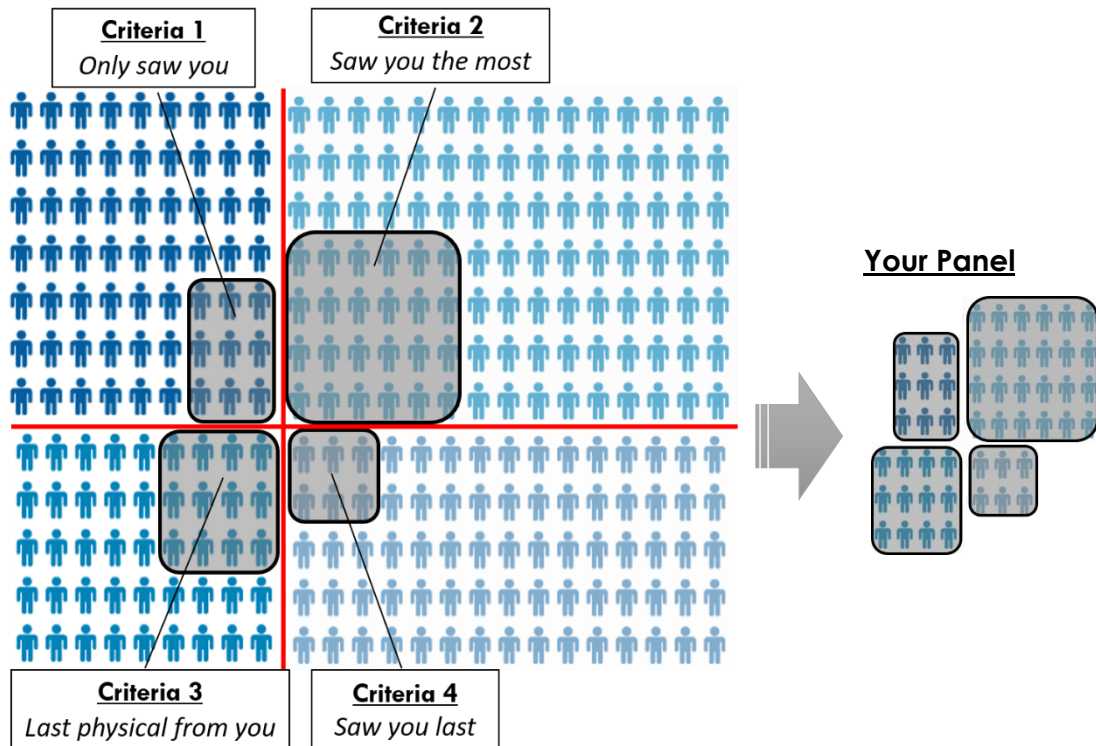

The population of SK patients is divided into 5 groups:

Within each group, patients are assigned to different physicians' panels based on the following criteria:

	Patients who had all of their FP visits with 1 physician	→	The physician they saw
	Patients who saw more than 1 physician but 1 the most	→	The physician they saw the most
	Patients without a most common physician but had a physical	→	The physician with whom they had their most recent physical
	Patients without a most common physician and did not have a physical	→	The physician they saw most recently
	Patients who did not see a family physician in the past 3 years	→	Unattached in network

These criteria identify your patients within these groups:

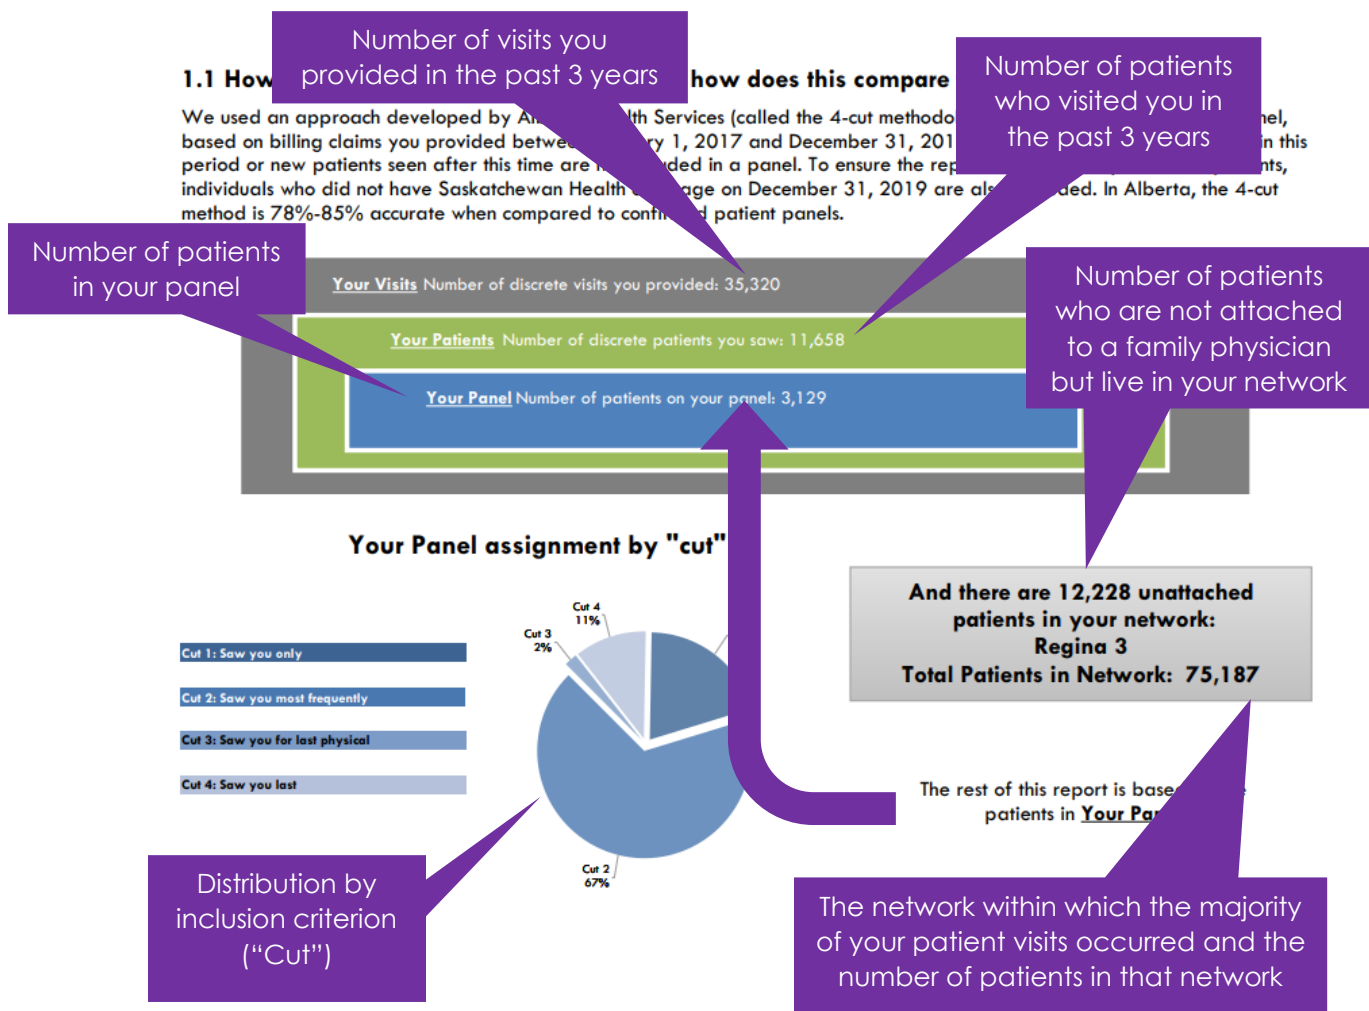

The resulting cohort of patients is being used to calculate your panel's results for the indicators in the report.

The Indicators – How to interpret the numbers and figures

1.1 How many patients are on my panel and how does this compare to the patients I've seen?

- provides a summary of your panel as determined via the 4-cut method
 - o total number of visits provided by you
 - o total number of discrete patients who visited you
 - o your total panel size (per the 4-cut method)
 - o pie chart showing the proportion of your panel assigned by each of the four criteria
 - o total number of “unattached” patients, those who were not assigned to a family physician, (i.e., had 0 FP visits during the 3 year period) residing in your Health Network as of December 31, 2019
 - o total number of patients residing in your Health Network as of December 31, 2019

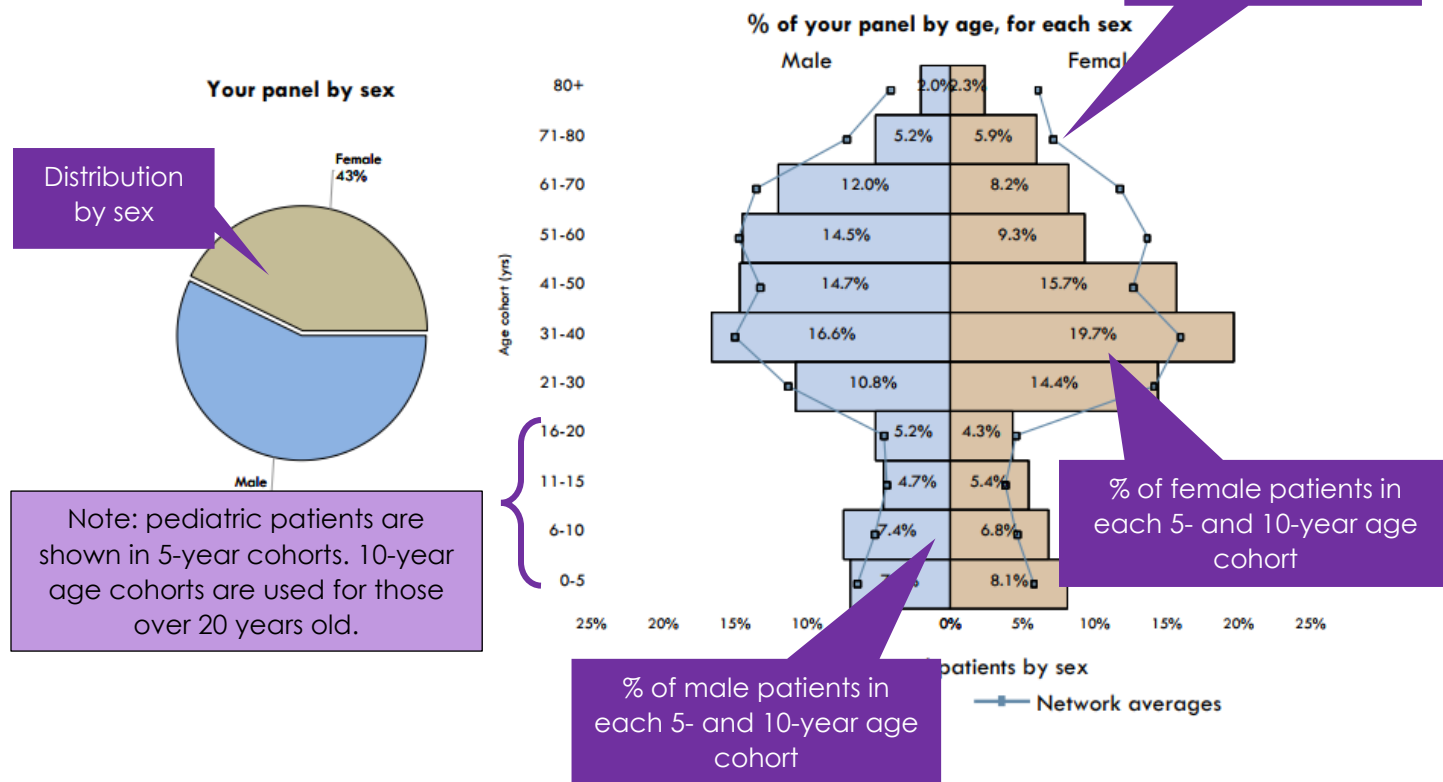

1.2 Who are the patients on my panel and how often do I see them?

- Provides the age and sex profile of your panel of patients and the panels of other physicians in your Health Network
 - o Pie chart showing the proportion of female and male patients
 - o Bar chart showing the proportion of your patients by sex and 5-year (up to age 20) and 10-year age cohort
 - Left hand bars display males by age cohort; right hand bars display females by age cohort
 - Line graphs on each side outline your Health Network age distributions by sex

1.2 What is the age and sex profile of my panel patients?

How and why people interact with the health care system can vary by age and sex. The graphs below show your patient profile based on these factors, which may help you understand your workload, patient behaviours and preferences to improved planning and outcomes.

2.1 How are my visits distributed by patient age and sex? How does this compare to the demographics of my panel overall?

- Contrasts the age and sex distribution of your panel population to your patient visits
 - o Left hand graph provides results for males; right hand graph provides results for females
 - o Left hand side of each graph (light bars) shows proportion of your male/female panel patients in each 5- and 10-year age cohort
 - These values are the same as were shown on the previous page
 - o Right hand side of each graph (dark bars) shows proportion of your male/female visits by age cohort.

2. Primary Care

% of your male panel population by 5- and 10-year age cohort

visits distributed by patient age and sex? How

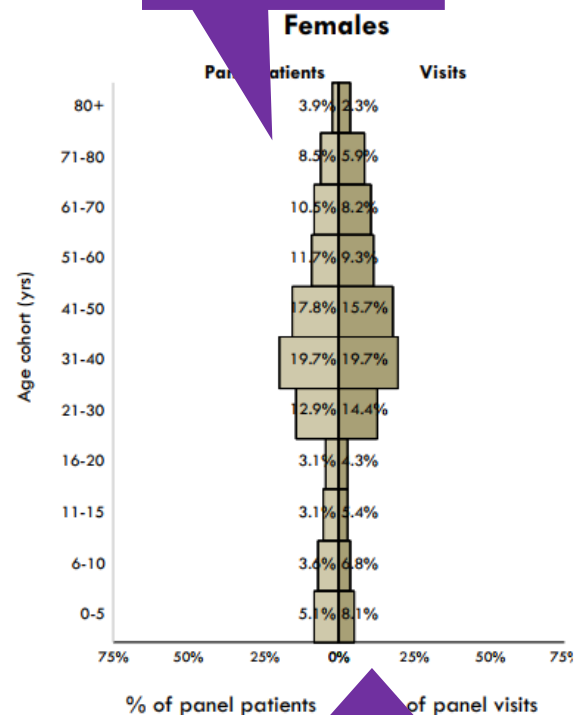

relationship between % of your panel, and % of your visits that some patient cohorts have far more (or less) visits

% of your female panel population by 5- and 10-year age cohort

Comparing these difference in your panel

% of your visits for males that were for patients in each 5- and 10-year age cohort

% of your visits for females that were for patients in each 5- and 10-year age cohort

Note: as with the previous indicator, pediatric patients are shown in 5-year cohorts. 10-year age cohorts are used for those over 20 years old.

2.2 What is my panel's continuity of care?

Connectedness to you

- Shows the proportion of your patients that are
 - o highly connected to you (had $\geq 80\%$ of their family physician visits with you),
 - o have low connectedness with you ($\leq 40\%$ of their visits were with you), or
 - o in between, or medium connectedness (41% - 79% of their visits with you).

Imagine a patient who had 3 family physician visits in the past 3 years...

If all 3 of those visits were with you, they are 100% connected to you

- **Connectedness: high**
- They would have been assigned in "Cut 1" – saw only you

If 2 of those visits were with you, they would have 66.7% connectedness to you

- **Connectedness: medium**
- They would have been assigned in "cut 2" – most of their visits with you

If 1 of those visits was with you, they would have 33.3% connectedness to you

- **Connectedness: low**
- They would also have had only 1 visit with 2 other physicians, otherwise they would have ended up on someone else's panel. They were assigned to you in "Cut 3" or "Cut 4" – you provided their most recent physical or visit, AND they did not have another provider they saw more often.

Connectedness to your Clinic

- Shows the proportion of your patients that are
 - o highly connected to your clinic (had $\geq 80\%$ of their family physician visits with you or one of your colleagues),
 - o have low connectedness with your clinic ($\leq 40\%$ of their visits were with you or one of your colleagues), or
 - o in between, or medium connectedness with your clinic (41% - 79% of their visits with you or your colleagues).

Note: your panel's connectedness *to you* may be higher than *to your clinic* if you see seeing some patients outside of your primary clinic (e.g., walk-ins, community clinics)

Network Average

- Provides your Health Network results as a comparison
 - o The average proportion of patients at each level of connectedness to their panel physician across all other family physicians in your network

- The bar chart shows where your panel patients received primary care over the past 3 years and any trends that may exist.

any 3-year period, many patients will see more than one family physician. As continuity of care (i.e. seeing the same doctor) is associated with better patient outcomes, the pie charts show your panel's continuity. This is calculated as the **percentage of their FP visits that were with you or your clinic**, to reflect team-based care.

2.3 What is my panel's most common conditions?

- Provides a summary of the top 10 most common reasons your patients saw a family or a non-family physician.
- These results are based on the ICD codes submitted with billing claims, which leads to some limitations:
 - Physician billing data only includes 1 diagnostic code per patient visit - this may affect the results shown as the code on record may not be the most responsible diagnosis
 - Diagnostic codes exclude decimals which may also limit the level of detail available
 - Physician billing data may not be complete as records might not be complete for physicians who are not paid on a fee-for-service basis due to varying shadow billing practices
- Left hand graph provides the top 10 reasons for visits to family physicians, the percentage of your patients' FP visits associated with that condition, and the network average
- Right hand graph shows the top 10 reasons for your panel patients' visits to non-family physicians, the percentage of their non-FP visits associated with each condition, and the network average
 - an important note is that radiological codes are excluded so that underlying conditions for imaging are more visible

2.3 What are the most common conditions driving my patients' physician visits?

This page tells you the most common reasons why your patients see both family physicians and non-family physicians (e.g., Emergency Medicine physicians etc.). It is based on billing data and only reflects the first diagnostic code associated with the visit. Are there gaps? Are you caring for patients/cohorts where you believe there are not the appropriate support resources in the Network or within your practice? How could you advocate for your patients' needs?

The most common medical condition among your patients that led them to visit a family physician

The most common reason your patients saw a family physician was...

Diabetes mellitus

The most common reason your patients saw other physicians was...

Diabetes mellitus

The most common medical condition among your patients that led them to visit a non-family physician

Top 10 Reasons for visits to... Family Physicians

Condition		
1 Diabetes mellitus		
2 Essential hypertension		
3 General symptoms		
4 General medical examination		
5 Disorders of lipid metabolism		
6 Acute upper respiratory infections of unspecified sites		
7 Deficiency of B-complex components	2.1%	0.7%
8 Acute pharyngitis	2.0%	1.1%
9 Other and unspecified disorders of back	1.0%	1.8%
10 Other disorders of urethra and urinary tract	0.7%	1.5%

10 most frequently occurring conditions among your panel patients' non-FP visits

Other Physicians*

Condition		Network Avg
1 Diabetes mellitus	3.6%	3.6%
2 Essential hypertension	4.5%	4.5%
3 General symptoms	3.3%	3.3%
4 General medical examination	2.4%	3.1%
5 Normal pregnancy	2.2%	2.3%
6 Acute upper respiratory infections of unspecified sites	2.1%	1.8%
7 Deficiency of B-complex components	1.9%	2.2%
8 Acute pharyngitis	1.9%	1.2%
9 Other and unspecified disorders of back	1.8%	2.1%
10 Acute upper respiratory infections of multiple or unspecified sites	1.2%	1.3%

Network average for non-FP visits

Network average for FP visits

* Other Physicians: Specialists, Emergency Medicine, etc.

Note: Excludes codes for... codes

% of your patients' FP visits that were for 8th most frequently occurring condition (the condition is specific to your panel)

% of your patients' non-FP visits that were for 8th most frequently occurring condition (the condition is specific to your panel)

10 most frequently occurring conditions among your panel patients' FP visits

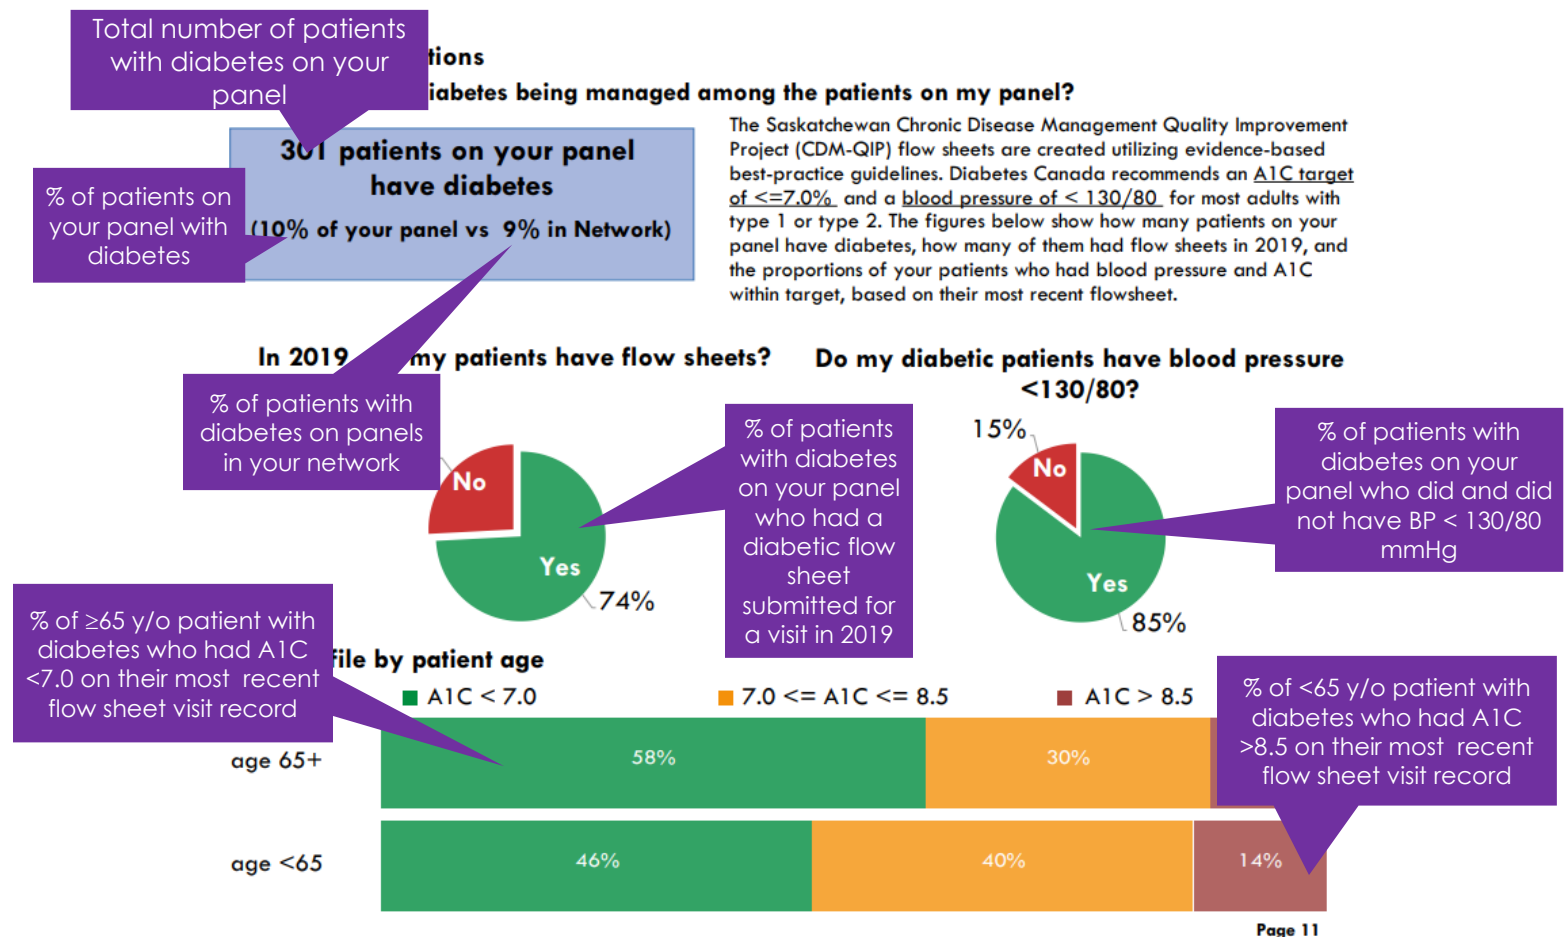

3.1 How well is diabetes being managed among the patients on my panel?

Provides insight into management of patients with diabetes through 4 indicators:

- Total number and proportion of patients on your panel with diabetes
 - With average proportion of patients with diabetes across panels of all physicians in your network as a comparator
- The proportion of the patients with diabetes on your panel who had at least 1 diabetic CDM-QIP flow sheet submitted for a visit in 2019
 - With corresponding proportion without a flow sheet

Among the panel patients with diabetes with a diabetic flow sheet:

- the proportion of patients whose blood pressure was below 130/80 mmHg on their most recent diabetic CDM-QIP flow sheet visit record
 - With corresponding proportion at or above 130/80
- The proportion of patients who had A1C levels <7.0, >8.5, or in-between stratified by their age (<65 or 65+ y/o) on their most recent CDM-QIP flow sheet visit record

Page 11

3.2 How well is coronary artery disease (CAD) being managed among the patients on my panel?

Provides insight into the management of patients with CAD through 5 indicators:

- Total number and proportion of patients on your panel with CAD
 - o With average proportion of patients with CAD across panels of all physicians in your network as a comparator
- The proportion of the patients with CAD on your panel who had at least 1 CAD CDM-QIP flow sheet submitted for a visit in 2019
 - o With corresponding proportion without a flow sheet
- The proportion of patients with CAD who are receiving statins (i.e. who filled a prescription for statins in 2019), and those who are not
- Among the panel patients with CAD and a CAD flow sheet:
 - o the proportion of patients whose blood pressure was below 140/90 mmHg on their most recent CAD CDM-QIP flow sheet visit record
 - With corresponding proportion at or above 140/90
 - o The proportion of patients who had LDL levels > 2 mmol/L on their most recent CDM-QIP flow sheet visit record
 - With corresponding proportion ≤ 2

Total number of CAD patients on your panel

3.2 How well is coronary artery disease (CAD) being managed among the patients on my panel?

136 patients on your panel have CAD

(4% of your panel vs 6% in Network)

Your HN average % of CAD patients

CAD is also targeted through the CDM-QIP program. CAD is an indication for statins and the Canadian Cardiovascular Society recommends an $LDL < 2 \text{ mmol/L}$ or $> 50\%$ reduction in LDL with statin therapy. The figures below show how many patients on your panel have had blood pressure and LDL within target, based on their most recent flowsheet.

Among your panel patients with CAD...

What proportion had flow sheets in 2019?

What proportion are on statins?

% of CAD patients on your panel who are on Statins

Among your panel patients with CAD flow sheets...

How many have blood pressure <140/90?

% of CAD patients on your panel with BP < 140/90 mmHg

What proportion had LDL $\leq 2 \text{ mmol/L}$?

% of CAD patients on your panel who have LDL $\leq 2 \text{ mmol/L}$

4.1 How often did my panel patients visit an emergency department (ED)?

Provides insight into your patients' use of EDs through three indicators:

- The proportion of your patients who visited emergency department in the past year as well as the proportion of other panels in your Health Network
- Going into more detail:
 - o the proportion who did not visit an ED vs number with 1, 2, 3 or 4, or 5+ ED visits in 2019
 - o the proportion of all of your panel patients' ED visits during the report period by CTAS level, and the comparable results for other panels in your network.
 - o for more information on CTAS levels see www.bestpracticesask.ca/resources)
- Important limitations to consider are:
 - o Not all emergency departments are reporting visit data to the National Ambulatory Care Reporting System, and those that are provide varying levels of detail, thus data may be missing.
 - see the FAQ at www.bestpracticesask.ca/resources for details regarding included/excluded sites.

4. Acute Care Utilization

4.1 How often did my panel patients visit an emergency department (ED)?

Emergency departments are designed to serve patients with immediate care needs. The figure below shows your panel's emergency visits, divided by triage levels. Research shows that a small number of patients are responsible for a large proportion of health care use. Do you see this pattern in your panel? Did a lot of your patients visit an ED three or more times in the past year?

% of your patients with an ED visit in the past year

Panel's ED utilization in 2019?

% of patients by number of ED visits

Of your patients, the proportion who did not go to ED in the past year

proportion of your panel that appear low? It may be that you submit records to the National Ambulatory Care Reporting Service. For more details see the "Data Collection" (pg 23) for more details

The number of patients on your panel who visited an ED 5 or more times in 2019

Panel patients that visited an ED in past 3 years:
39% of your panel
Average in your network: 37%

average % of panels in your HN who went to an ED

How acute were they?

% of ED visits in past 3 years by CTAS level

Of your patient's ED visits, the proportion deemed CTAS level 4

Canadian Triage and Acuity Scale (CTAS) Levels

- Level 1 - Resuscitation
- Level 2 - Emergent
- Level 3 - Urgent
- Level 4 - Less urgent
- Level 5 - Non-urgent

The proportion of all ED visits in your HN deemed CTAS level 4

4.2 What are my patients' ED visits for minor conditions by time of day?

This page repeats the proportion of your panel patient's ED visits by CTAS level from the previous page, highlighting the CTAS 4 and 5 visits, and shows how many of these CTAS 4 & 5 visits occurred by time of day by year.

Note that CTAS 4 & 5 conditions differ from Ambulatory Care Sensitive Conditions (ACSCs) (see www.bestpracticesask.ca/resources)

Time of day periods are defined as

- day: 8am – 5pm
- evening: 5pm – 10pm
- night: 10pm – 8am

4.2 How often did my patients visit an emergency department (ED) for minor conditions?

This indicator shows ED visits for patients in your panel based on their CTAS level, further divided by the time of day they arrived at the ED.

Avoidable ED visits:

- Delay treatment for more urgent patients
- Can lead to unnecessary treatments
- Increase care costs
- Can put patient safety at risk.

% of your panel's ED visits by CTAS level

Your panel's CTAS 4/5 ED visits by time of day and year

Of those on your panel who visited ED with CTAS 4 and 5, number of your patients' visits that occurred in the evening in 2019

Of those on your panel who visited ED with CTAS 4 and 5, number of your patients' visits that occurred in the overnight in 2019

Interested in learning how CTAS 4/5 conditions differ from Ambulatory Care Sensitive Conditions (ACSCs)? See: www.bestpracticesask.ca/resources

4.3 What percentage of my patients were admitted to a hospital?

- Provides information summarizing your patients' hospital admission frequency and length of stay (LOS), specifically:
 - o The proportion of your patients that were admitted to a hospital in the past year
 - o The total number of admissions for your patients
 - o Your patients' average LOS in days
 - o Of your patients who were admitted, the proportion of your patients who had 1, 2, 3-4, and 5+ times admissions in the past year
 - o Total number of admissions by age (<18, 18-59, 60+) and from where they were admitted (via ED or Other).
- Your Health Network results are provided for frequency, proportion of admissions, and LOS as comparators

4.3 How frequently were my patients admitted to hospitals?

The data below summarizes their length of stay by age.

% of your patients with an inpatient admission, number of admissions, and average LOS in the past year

How many admissions were there by age?

How many admissions were there by age? (Patients with multiple admissions and a break in care are counted as multiple admissions.)

HN average comparators for % of patients with an inpatient admission, number of admissions, and average LOS in the past year

	Your Panel	Network Average
% of patients admitted	7%	8%
# of hospital admissions	235	107
Average Length of Stay (LOS)	5 days	8 days

Of your patients who were admitted, the proportion who were admitted 3-4 times in the last year

How many admissions were there by age?

Legend: Via ED (Blue), Other (e.g., direct, obstetrics) (Brown)

Of your patients who were admitted, the proportion who were admitted once

Number of your patients older than 60 who were admitted inpatient via EDs

Average number of patients older than 60 on panels in your network who were admitted inpatient via EDs

4.4 Why were my patients admitted to hospital during last year and how long were they there?

- The first line provides the most common reason your patients were admitted to hospital(s)
- The second line provides the longest average length of stay in hospital for your patients
- The bar graphs provide a list of the 10 most common reasons your patients were admitted to an acute care hospital during the past year based on ICD-10 codes. It also shows:
 - o The number of patients admitted for each reason
 - o The number of admissions occurring for each reason
 - o The average length of stay for your panel patients (in days)
- Your Health Network results are provided for the number of patients, admissions, and LOS for each reason as comparators

4.4 Why were my patients admitted to hospitals last year and how long were they there?

Here are the most common reasons for your patients' hospital admissions during the past year (2019). Day surgeries are not included. The figure shows the number of patients admitted, the number of admissions, and the average length of stay (LOS) for your patients versus the network average.

The most common medical condition for which your patients were admitted to hospital was...
Z38 Liveborn infants according to place of birth

The longest average LOS among your patients was for...
I50 Heart failure

The condition with the longest average LOS for your patients

Your Health Network average LOS for the most common reason

Number of your patients admitted to hospital for the most common reason

number of patients, admissions and LOS for the top 10 conditions

	# of Patients		# of Admissions		Average LOS (days)	
	Your Panel	Network Avg	Your Panel	Network Avg	Your Panel	Network Avg
Z38 Liveborn infants according to place of birth	27	13	27	13	2	2
K35 Acute appendicitis	9	3	9	3	3	2
O70 Perineal laceration during delivery	8	4	8	4	1	2
O68 Labour and delivery complicated by fetal stress [distress]	6	6	6	6	3	2
5 O34 Maternal care for known or suspected abnormality of pelvic organs	6	3	6	3	2	
6 J18 Pneumonia, organism unspecified	5	4	5	4	5	9
7 I50 Heart failure	5	3	6	4	11	13
	4	1	4	1	2	3
	4	2	4	3	5	4
	4	4	5	4	5	5

Your Health Network average number of admissions for the most common reason

Number of admissions for the most common reason among your panel patients

4.5 How does continuity of care relate to hospitalizations for conditions that are best cared for in primary care?

- Provides information relating your patients' continuity of care and their hospitalizations for the conditions that are best cared for in primary care known collectively as Ambulatory Care Sensitive Conditions (ACSCs)
 - o The left bar graph shows the number of admissions for your patients with conditions that are best cared for in primary care stratified by the patient's level of connectedness to you. (See page "What is my panel's continuity of care" for more details on this calculation).
 - o The right bar graph shows the average LOS in days for your patients with conditions that are best cared for in primary care stratified by patient's level of connectedness to you.
 - o Patients with only 1 visit in the past three years are not assigned any level of connectedness but are shown at the bottom to ensure their ACSC visits are represented.

4.5 How does continuity of care relate to hospitalizations for conditions that are best cared for in primary care?

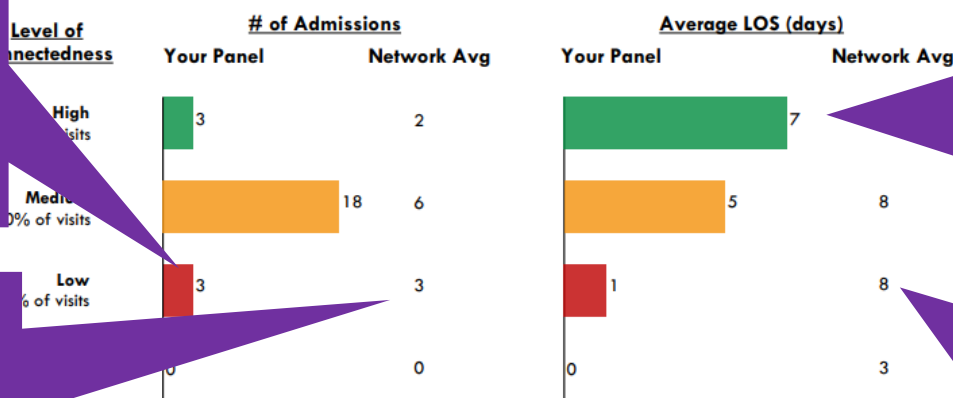

The table below shows your patients' admissions, lengths of stay, and re-admissions for Ambulatory Care Sensitive Conditions (ACSC), divided according to their level of continuity/connectedness (i.e., low, medium, and high connectedness). The research shows that continuity of care improves patient outcomes and reduces hospital admissions and re-admissions.

Which conditions are included?

- Asthma
- Congestive heart failure
- COPD
- Coronary artery disease
- Diabetes
- Mood Disorders

ACSC's only apply to patients under age 75

Number of admissions and LOS by connectedness level

Among your patients who had low connectedness with you (i.e., <40% connectedness), number of admissions that were due to the conditions that are best cared for in primary care

Your HN average number of admissions that were due to the conditions that are best cared for in primary care among the patients with low connectedness to their family physicians

Among your patients who had high connectedness with you (i.e., >80% connectedness), average LOS for the conditions that are best cared for in primary care

Your network's average LOS for conditions that are best cared for in primary care among the patients with low connectedness to their family physicians

Interested in learning more about Ambulatory Care Sensitive Conditions (ACSCs)? See: www.bestpracticesask.ca/resources

5.1 What percentage of my senior patients (65+) are on one or more medications listed in Beers Criteria?

- Provides information about the dispensation of Beers drugs among your panel patients:
 - o The top column chart shows the proportion of your senior patients that were on 1, 2, or 3+ drugs on the Beers list at any point in the past year (2019) as well as those using them chronically. Chronic Use is defined within this report as at least 2 dispensations of a medication within 6-weeks of each other, and at least 2 dispensations of the drug within 6-months. For example:

- o The bar chart shows the proportion of your panel patients on the top 5 most common Beers list drugs in the province
- Your Health Network (HN) results are provided for comparison

5.1 Prescribing for Senior Citizens: High Risk Medications

The Beers Criteria have helped inform clinical decision-making concerning the prescribing of medications for older adults in order to improve safety and quality of care since 1991.

- Adverse drug events are more common in individuals taking more high risk medications. This list is not meant to supersede clinical judgment or an individual patient's values and needs (AGS, 2019).

Reducing polypharmacy is also recommended to reduce pill burden, risk of adverse drug events, and financial hardship.
(American Family Physician)

What percentage of your patients 65 and older took one or more medications listed in the Beers Criteria?

In the past year (2019)

Chronic Use

5 most frequently prescribed Beers drugs in Saskatchewan.

How many of your patients have received them versus network averages?

Interested in learning more?
Or curious how to interpret this data?

In your HN, % of patients who are on the most common Beers drug

5.2 What percentage of my senior patients (65+) filled prescriptions for anti-psychotic medications?

The column graph provides the proportion of your patients aged 65 years and older who have filled prescriptions for anti-psychotic medications, by year for the past 3 years.

- Your Health Network average rates are provided as a comparator

The table shows, among the patients that had anti-psychotics dispensed to them, the proportion that received those prescriptions from:

- You only
- You and your clinic colleagues (based on your primary practice location)
- You and others
- You and clinic colleagues and others
- Clinic colleagues only
- Clinic colleagues and others
- Others only
 - o For example:
 - if Patient A only filled a prescription for anti-psychotic medication once and it had been prescribed by you, Patient A would be counted in the "You only" category.
 - If Patient B filled one prescription for anti-psychotic medication that was written by you and then written from another provider, Patient B would be in the "You and Others" category.

The second column graph shows the number of days in 2019 for which they have received antipsychotic medication (days supplied). An important note is that this is based on data provided by pharmacies and has not yet been validated by the Ministry of Health.

- Your Health Network average rates are provided as a comparator

5.2 Prescribing for Senior Citizens: Antipsychotic Medications

Antipsychotics are commonly prescribed to seniors with dementia who experience behavioural and psychological symptoms, including delusions, aggression, and agitation (CIHI, 2016).

- The American Geriatric Society recommends avoiding their use unless non-pharmacologic options have failed, and patient is a threat to self or others (strong recommendation, moderate quality of evidence).
- Studies have found that antipsychotics may be overused in seniors and are associated with increased mortality in some cases.

% of your patients aged 65 and older who filled prescriptions for antipsychotics in 2017

% of your patients over age 65 receiving antipsychotics by year

% of patients in your HN aged 65 and older who filled prescriptions for antipsychotics in 2017

For seniors (age 65+) receiving antipsychotics:

Who prescribed them?
% by prescribing source

You only	18%
You & your clinic colleagues	35%
You & others	0%
Others	12%
Others	0%
Others	0%
Others	35%

Among your patient's aged 65 and older, this % only filled prescriptions for antipsychotics obtained from you only

% of senior patients by # of days in past year (2019) for which they received medication

% of patients in your HN aged 65 and older receiving antipsychotics who received 1-60 days supply of antipsychotics in 2019

% of your patients aged 65 and older receiving antipsychotics who received 241-300 days supply of antipsychotics in 2019

5.3 What percentage of my patients filled prescriptions for opioid medications?

The column graph provides the proportion of your patients who have filled prescriptions for opioid medications, by year for the past 3 years.

- Your Health Network average rates are provided as a comparator

The table shows, among the patients that had opioid dispensed to them, the proportion that received those prescriptions from:

- You only
- You and your clinic colleagues (based on your primary practice location)
- You and others
- You and clinic colleagues and others
- Clinic colleagues only
- Clinic colleagues and others
- Others only
 - o For example:
 - if Patient A only filled a prescription for opioid medication once and it had been prescribed by you, Patient A would be counted in the "You only" category.
 - If Patient B filled one prescription for opioid medication that was written by you and then written from another provider, Patient B would be in the "You and Others" category.

The second column graph shows the number of days in 2019 for which they have received opioids (days supplied). An important note is that this is based on data provided by pharmacies and has not yet been validated by the Ministry of Health. In particular, there may be uncertainty around the number of days for which opioid prescriptions that are provided via patch may supply.

- Your Health Network average rates are provided as a comparator

5.3 Prescribing of Opioid Medications

The College of Family Physicians of Canada has published guidelines regarding opioid prescribing:

- Don't continue opioid analgesia beyond the immediate postoperative period or other episode of acute, severe pain
- Don't initiate opioids long-term for chronic pain until there has been a trial of available non-pharmacological treatments and adequate trials of non-opioid medication

See recommendations at <https://portal.cfp.ca/Portals/0/Opioid%20Guidelines.pdf>

% of your panel patients receiving opioids by year

% of your patients who filled prescriptions for opioids in 2017

% of patients in your HN who filled prescriptions for opioids in 2017

Among those receiving opioids:

Who prescribed them?
% by prescribing source

Among your patients, this % only filled prescriptions for opioids obtained from you only

% of patients receiving opioids in your HN who received 1-60 days supply of opioids in 2019

% of panel patients by # of days in 2019 for which they received medication

% of your patients receiving opioids who received 241-300 days supply of opioids in 2019

5.4 What percentage of my patients filled prescriptions for benzodiazepine medications?

The column graph provides the proportion of your patients who have filled prescriptions for benzodiazepine medications, by year for the past 3 years.

- Your Health Network average rates are provided as a comparator

The table shows, among the patients that had benzodiazepine dispensed to them, the proportion that received those prescriptions from:

- You only
- You and your clinic colleagues (based on your primary practice location)
- You and others
- You and clinic colleagues and others
- Clinic colleagues only
- Clinic colleagues and others
- Others only
 - o For example:
 - if Patient A only filled a prescription for benzodiazepine medication once and it had been prescribed by you, Patient A would be counted in the "You only" category.
 - If Patient B filled one prescription for benzodiazepine medication that was written by you and then written from another provider, Patient B would be in the "You and Others" category.

The second column graph shows the number of days in 2019 for which they have received benzodiazepine medication (days supplied). An important note is that this is based on data provided by pharmacies and has not yet been validated by the Ministry of Health.

- Your Health Network average rates are provided as a comparator

5.4 Prescribing of benzodiazepines

Benzodiazepines may be of benefit for some patients experiencing Generalized Anxiety Disorder (GAD). They can reduce both somatic and emotional symptoms of GAD. There is significant concern, however, regarding:

- dependence and withdrawal (depending on duration of use)
- tolerance
- impaired psychomotor function and memory
- rebound anxiety (after short-term use)
- increased use to

% of your patients who filled prescriptions for benzos in 2017

% of your panel patients receiving benzodiazepines by year

% of patients in your HN who filled prescriptions for benzos in 2017

Among those receiving benzodiazepines:

Who prescribed them?
% by prescribing source

You only	18%
You & your clinic colleagues	12%
You & others	2%
You & clinic colleagues & others	2%
Others	4%
Others	0%
Others	61%

Among your patients, this % only filled prescriptions for benzos obtained from you only

% of panel patients by # of days in 2019 for which they received medication

% of patients receiving benzodiazepines in your HN who received 1-60 days supply of benzodiazepines in 2019

% of your patients receiving benzodiazepines who received 241-300 days supply of benzodiazepines in 2019

Next Steps

Get your Mainpro+ Credits

- To claim your 10 Mainpro+ Credits for reviewing your panel with this interpretation guide, you have to complete the reflection report online
 - Go to <https://bestpracticesask.ca/education> and click on "reflection report" in the Interpretation Guide section: (remember to hit the submit button at the end)

INTERPRETATION

Learn how to read your report and understand what each indicator means and how to interpret it.

Interpretation Guide

Click on this button on the website to complete the reflection report online

4. Receive 10 Certified Mainpro+ Credits

Download Guide

Reflection Report

Interpretation Session

1. Register for session (session is 5 hours)
2. Attend and participate
3. Complete reflection report
4. Receive 15 Certified Mainpro+ Credits

Dates and Registration

Reflection Report

Investigate further with the Investigation Guide

- If you are interested in investigating further into your panel report, you can review your panel with the Investigation Guide for 10 Mainpro+ Credits.
 - Go to <https://bestpracticesask.ca/education> and download the Investigation Guide to get started
- If you are interested in attending an in-person Investigation Session for 15 Mainpro+ Credits, you can register on the same page

INVESTIGATION

Delve deeper into your report by exploring more in depth questions related to each indicator to get a better understanding of what the results tell you about your practice and your patients.
